Preface	xi
Acknowledgments	xvii
List of figures	xix
List of tables	xxiii
List of abbreviations and acronyms	xxv
1 Introduction and rationale	1
1.1 Breaking ocean waves in the atmosphere–ocean system	1
1.1.1 Wave dynamics at wave breaking	1
1.1.2 Energy exchange at wave breaking	2
1.1.3 Gas exchange in the ocean–atmosphere system	4
1.2 Breaking ocean waves and microwave remote sensing	5
1.3 Classification of investigation techniques: methodology of experiments	7
1.4 Conclusions	8
2 Spatial stochastic breaking wave fields in the atmosphere–ocean system .	9
2.1 Statement of the problem of studying the spatial stochastic structure of breaking waves	9
2.2 Technique and conditions for performing field experiments	10
2.2.1 Meteorological conditions during the experiment and the flight performance technique	11
2.2.2 Technique for performing the contact part of the experiment and data processing	13

2.2.3	The stratification state and the turbulent mode of a near-surface layer. The “net” fetch conditions	13
2.2.4	Restoration of the spectral characteristics of the sea surface from its optical images	16
2.2.5	Spatial-spectral structure of sea waves	18
2.3	Spatial-statistical properties of a breaking wave field in developed seas	21
2.3.1	The technique of formation and processing of a random-point field	22
2.3.2	Laws of specific density distribution	23
2.3.3	Spatial homogeneity and representativeness of a breaking field	28
2.3.4	Linear non-correlation of breaking fields	30
2.3.5	Azimuth homogeneity of breaking fields	31
2.3.6	Markov’s property of the breaking field	33
2.4	Spatial-statistical properties of a developing sea breaking field	36
2.4.1	The technique of forming and processing the random point field	36
2.4.2	Markov property of the breaking field	38
2.4.3	Laws of specific density distribution	40
2.4.4	Linear non-correlation of breaking center specific density	40
2.4.5	Spatial homogeneity of breaking center specific density.	42
2.5	Fractal properties of wave-breaking zones in stationary and developing seas	42
2.5.1	Techniques of formation and processing of the random-point field for fractal processing	43
2.5.2	Fractal properties of breaking fields under developed sea conditions	43
2.5.3	Fractal properties of breaking fields under developing sea conditions	46
2.6	Conclusion.	48
3	Linear and two-dimensional geometry of whitecapping and foam structures	49
3.1	The problem of studying the spatial-stochastic structure of individual breaking waves	49
3.2	Remote investigation of individual foam structures in the wave-breaking process	50
3.3	Processing the data from remote sensing of individual foam structures in the wave-breaking process	52
3.4	Statistics on the elements in the linear geometry of individual foam structures in the wave-breaking process	58
3.5	Statistics of elements of the two-dimensional geometry of individual foam structures in the wave-breaking process	61
3.6	Statistics of the specific density of breaking centers	68

3.7	A spatial field of wave breakings and the overshoot theory for a random Gaussian field	72
3.7.1	Properties of a flux of fixed level crossings by the Gaussian field	73
3.7.2	The intensity of a flux of fixed level crossings by the Gaussian field and experimental observations	75
3.7.3	Regions of overshoots of an isotropic Gaussian field and experimental observations	77
3.7.4	On the relationship between the dissipation and transparency intervals in spectra of sea wave heights	79
3.8	Conclusions	80
4	The lifetime dynamics of sea wave breakings	83
4.1	The problem of studying the lifetime dynamics of the sea wave breaking process	83
4.2	Technique and conditions of field experiments	85
4.2.1	Optical observations of the temporal evolution of the breaking process	86
4.2.2	Optical image processing technique	89
4.3	Temporal evolution of the breaking process	90
4.4	Spatiotemporal characteristics of mesobreakings	96
4.5	Spectral characteristics of an aerated layer	100
4.6	Conclusions	101
5	The drop-spray phase over a rough sea surface	103
5.1	Physical mechanisms of drop-spray phase generation	103
5.2	Disperse characteristics of the drop-spray phase	106
5.2.1	Laboratory measurements of the characteristics of a drop-spray phase	107
5.2.2	Field measurements of drop-spray phase characteristics	110
5.3	Conclusions	117
6	Electrodynamics of a rough, disperse, closely packed media	119
6.1	Foam as a colloidal system: physical and structural properties	119
6.2	Physical and chemical properties of sea foam	123
6.3	Disperse structure of sea foam in the Black Sea basin	128
6.4	Earlier measurements and “naive” electromagnetic models.	132
6.5	Experimental investigations of characteristics of roughly disperse systems by radiophysical methods	136
6.5.1	Laboratory analogs of foam systems and their disperse characteristics	136
6.5.2	Spectral and polarization properties of the radiothermal radiation of disperse systems.	139
6.5.3	Reflective properties of disperse systems in the microwave range	148

6.6	The theory of natural radiation of disperse closely packed systems	154
6.6.1	An inhomogeneous dielectric layer adequate for heterogeneous mixing of water and air	154
6.6.2	Transition and layer-inhomogeneous models	156
6.6.3	Electromagnetic properties of a bubble in the microwave range	157
6.6.4	Optical model of a disperse medium	166
6.6.5	Diffraction models of disperse systems	169
6.6.6	Layered, inhomogeneous diffraction model	173
6.7	Conclusions	177
7	Electrodynamics of concentrated drop flows	179
7.1	Electromagnetic properties of secluded particles	179
7.1.1	The scattering cross-section and scattering amplitude	180
7.1.2	The absorption cross-section	182
7.1.3	The extinction cross-section	182
7.1.4	Single-scattering albedo	183
7.1.5	The scattering indicatrix	183
7.2.	Basic concepts of the Mie theory	184
7.2.1	Parameters of the Mie theory	185
7.2.2	The main results of the Mie theory	186
7.2.3	The three regions of Mie scattering	188
7.3	Scattering properties of aqueous particles	189
7.4	Electromagnetic properties of polydisperse media	194
7.4.1	The density function	195
7.4.2	The volume density of particles	195
7.4.3	The integral distribution function	196
7.4.4	The relative density function	196
7.4.5	The density sampling probability	196
7.4.6	The total mass and the relative volume concentration of water	197
7.4.7	Radar reflectivity	198
7.4.8	Rainfall rates	198
7.4.9	Analytical forms of the density function	199
7.4.10	Parameters of attenuation and scattering of a polydisperse medium	200
7.5	Backscattering by natural polydisperse volume targets	204
7.6	Features of radiative transfer in dense media	209
7.6.1	A disperse medium and its characteristics	210
7.6.2	Experimental technique and instruments	211
7.6.3	Average values of electrodynamical characteristics	213
7.6.4	Fluctuation mode of extinction	215
7.7	Conclusions	221

8	Field optical–microwave remote sensing of the air–sea transition zone in the atmosphere–ocean system	223
8.1	Space oceanography problems	223
8.2	Optical and radiophysical investigations of the oceanic gravity wave breaking process	227
8.2.1	Instruments, techniques, and conditions for performance of the experiment	227
8.2.2	Experimental investigations of natural breaking	228
8.2.3	Experimental investigation of the breaking of ship waves	235
8.2.4	Interpretation of results: the drop-spray model and a “radioportrait” of a breaking sea wave	237
8.3	Radio emission of crest and strip foam: field ship investigations	241
8.4	Radio emission of a breaking wave field: airplane investigations	246
8.5	Nonlinear dynamics of gravity waves in the breaking wave back-scattering field	251
8.5.1	Experimental region and wind–wave conditions	253
8.5.2	Radar measurement technique	253
8.5.3	Analysis of spatiotemporal diagrams	255
8.5.4	Analysis of spatial frequency spectra	257
8.6	Conclusions	261
9	Conclusions	263
	References	265
	Index	277
